Hi there and excuse the silly question: Is it possible to turn the pi 8 into a corner horn by pointing the midhorn section (with the alpha 10) toward the corner while still using the horn tweeter pointing forward as do other corner horns in the Pi speaker line up. If this worked without affecting the performance of the mid horn it might bring the bass up to a higher level? Perhaps this would change sound of the mid horn? Thanks in advance

placement isn't required, the cabinet is shaped so that they fit well in corners and can take advantage of this arrangement.
