In an earlier post below, (harshness and sibilance) you spoke of Wayne's floor treatment for wood floors. Where on the site is this info? Thanks in advance,
Russellc

Sure Russell He had the whole scheme spelled out in the archives before he updated the forum; you may have to go back 2 yrs. I can give very condensed overview which is basically he used a portable frequency response meter and tracked what resonances occurred under each section of the floor. Then he treated each section depending on what the readings were. If for some reason they are not on this archived board I know for a fact Wayne has it spelled out and I am sure he can provide the link. I would re-post what I did but it is probably best to get it from the source due to the fact that it is a long post. Biggest improvement if you have suspended floors, you will be amazed. J.R.

I think this is the one you are referring to: Solution for raised wood floors and crawlspaces There are a few more posts on the subject that can be found using "wood floors" in the search tool.

I see Wayne has replied and he instructed as to how to use the EQ to ameliorate floor resonances. I am not sure that is the post you seek however. What I did was First I sistered all the floor joists under the listening room. Then I purchased these sheets of high density acoustic foam. I stapled a sheet between each joist flush against the floor. Then I ran lateral stringers and mounted sheetrock on those. Every other joist I drilled a hole and pumped insulation into the

Ah! now this is really making sense, the floor isn't letting bass leak through, its flexing with the bass, robbing it of its impact that would otherwise exist in a Stiffer floored room. You will love costa rica, and you are going at the best time! everything blooms deluxe usually starting in november, every day is perfect and I mean perfect. No heat or A/C required. Rent a 4x4 (I used a toyota with diesel v8 that could climb walls. I pulled a few ticos out of the river with it...Thats right, some roads will just end at the river and pick up on the other side! You are going to love this trip. i intend to retire there or panama. The iguanas are not that scarey. I heard them coming around the house about the same time every day slowley rustling through the leaves, stopping to sun.

thanks for everything and have fun! Russelc thanks
for everything

Russell; saw some of your posts on the Altec foruum. Very informative,I hope you don't mind if I ask some questions in the near future, one of which is do you use the 515g in the A7's? Plenty more where that came from. Thanks much for the heads up on the iguanas. I get the Tico Times because I too have a plan for Costa Rica, providing the house prices slow down, jeez, what; they have doubled in 3 years! Thanks J.R.(Do you surf?)

I have never surfed my self, have played with boogie boards and so forth, to surf has always been a dream for me, and I swear my next visit I may go solo for lesons. I need to now, as I am in my forties. I have both the 5158g, as well as a set of 416 8c. Difficult to say which I like better, I listen to one for a few months and think it is superior, then change my mind when I switch back. Right now I would give the edge to the 416 8c. It is usually a little less expensive, has slightly lower bass, and seems somewhat more transparent. Of course, the 416 8c is in there now! the 5158g seems to have a more powerful midrange. Either of these drivers is great in the A-7. As for reflex, the 416 is superior,(in my opinion) although the 515 88g is not that far off. The 515 8g was specifically designed for an application like the A-7, horn on front and reflex on back. Do you surf? I have loads of questions on that topic.

Thanks, Russelc Russelc

Thanks for the info. I must say it is a surprise that you favor the 416, many favor the 515. Fine by me I like the 416 myself. Still checking on those plastic stabilizers on the 802's. I surf; at least I used to before kids. Still have my board, the thing is it's a shorty, only 6'6", good for cutting. However I am getting older and don't do much cutting so my board will go to my son who has basically coopted it anyway. I need to get a bigger board, maybe 8'9" due to old age issues, they are easier to ride. Nice conversations, lots of Altec stuff so I am thinking of building a Model 19 clone. Whaddya think?

Very popular altec, the model 19. I would definately go with the 416 for that one, as the woofer is straight bass reflex. I love the A-7, I have the later 828 cabs with the sealed flares. BUT.. they are gigantic! with that in mind I have collected a pair of JBL 2225h and a pair of jbl 2425h. With these, I can build a 4PI, much smaller at 28x18x15 or thereabouts. Also, with these drivers could do the 7PI, and with addition of the midhorn, the 3way PI7. I am trying to find time to build the boxes, and just can't, so now I am looking for a cabinet builder in the Kansas City area. (Yes, I am fully aware that all our sports teams are sucking deluxe). How is a larger board easier for us older guys to surf on? Not doubting, just know nothing about surfing. The house where I stayed in Costa Rica was located at "Beaches of Nosora", very close to the ocean, and there were several boards there, seems like they were around 7 feet or so, and very "pointy" on the ends. Man, do I ever miss that place, I need to go back bad. If I hadn't had a house full of pets back home, I think I would have abandoned it and the practice of law and become a bum. I continually met people who had done precisely that. What a place! The day I left I was lamenting to some local expats who smiled and said, "that is not our problem" "It doesn't have to be yours" surfing in my mind,

Might run into one another over there! The short Pointy boards are more manueverable and quicker to respond. But they are more difficult to control. The big boards are slower but easier to stay up. I agree, the JBL's are a big plus in terms of enclosure size. And of course the Pi 4's are great. It's a tough call. Too bad we can't have both.
