I was wondering if anyone has looked at using different lenses on the compression drivers? in specific this lens is getting very good reviews:<http://www.ddshorns.com/catalog.php?page=ENG190> I think that this lens in a three or four pi speaker would be good. any feedback?

I've heard pretty good things about some of the DDS horns too. But I don't have time to go through a test/development cycle right now, so can't really evaluate them. I have too much on my plate as it is for additional projects.

I've been on the fence about building some Pi two towers for a while, but the stuff I've heard about these flares is really good. I think that I might build up something around these in a Pi'ish fashion. If I do I will report back.
