The Alpha 12 works best on open baffles or large vented cabinets from 4.5ft³ to 60ft³ tuned to 20-25Hz. When going with a vented cabinet, the box size can really get excessive. But you can get acceptable results at the smaller end of the scale. PiAlign recommends 4.75ft³ and 22Hz Helmholtz frequency for the Alpha 12.

Please see the "readme.txt" file in the archive and ask if you have any questions.

Again, open baffle or really big box. That's the way it is for both the Alpha 12 and Alpha 15.
